

YohPal Mobile Flutter — Gap Report v8

Firebase: yohlab · Branch: flutter_app · Commit: 4e16ee4e (+ Phase 5G uncommitted) · flutter analyze: 61 issues

· flutter test: not executed · CF unit tests (jest): not executed

Date: 2026-07-15

Previous: v7 (post Phase 5A–5F complete)

↓ Print / Save PDF

Flutter Analyze

FAIL

61 issues · 7.3 s

Flutter Test

SKIPPED

No mobile unit tests were run in this session. The focus was on debugging the runtime feed regression and implementation behavior.

CF Unit Tests (jest)

SKIPPED

No Cloud Functions jest suite was executed as part of this mobile Flutter implementation report.

Device / Runtime Validation

PARTIAL

- App launched on Android device 863d00583048313238510c6fce604c.
- Device logs showed a Firestore PERMISSION_DENIED on appStartupDiagnostics, but the main UI process reached MainActivity.
- No direct feed UI log for No videos available yet was captured in the filtered adb output.

Overall Complete

~72%

↑ from v7 baseline in this mobile runtime-focused pass.

Sub-Phases Applied

1A–1F · 2A–2C · 2E · 3A–3D · 4A · 4B · 5A · 5B · 5C · 5E · 5F · 5G

Phase 5G Score

out of 100 · device E2E only gap

Analyze Issues

flutter analyze FAIL

P1 Blockers

- Feed regression: No videos available yet
- Firestore runtime permissions on diagnostics path

- Legacy zero-wait test coverage
- Device E2E validation not yet completed

What changed since v7

Phase 5G — Feed safety gating and empty-feed regression

- apps/mobile_flutter/lib/features/video_feed/controllers/video_feed_controller.dart
- Added stricter content validation in `_filter()`.
- Rejects videos with missing id, empty ageRating, and for minor-directed content requires:
 - `creatorVerifiedForMinorContent`
 - `guardianConsentVerified`
 - `minorTargetedAdvertiserApproved`
 - `classificationCompleted`
- Enforces `moderationStatus == 'approved'`.
- apps/mobile_flutter/lib/features/video_feed/screens/video_feed_screen.dart
- UI correctly shows:
 - loader while loading
 - retry state when error exists
- No videos available yet when the feed is empty
- This means the empty state is not a rendering bug; it is a consequence of the feed filtering logic.

Phase 5G — Feed subscription and pagination behavior

- `startSuggestedFeed()`, `startTrendingFeed()`, `startFollowingFeed()` now subscribe to Firestore snapshots with the correct query limits.
- `loadMore()` expands the live query page size for suggested and trending.
- `_filter()` intentionally skips recently viewed videos for suggested/trending feeds, preventing duplicates for the session.

Phase 5G — QA release identity and observability

- apps/mobile_flutter/lib/core/release/qa_release_identity.dart
- Added RC2 candidate identity metadata for QA certification.
- Uses exact release tag: ``yohpal-live-v1.0j-rc2``.
- apps/mobile_flutter/lib/core/observability/crashlytics_verification_service.dart
- Added release custom keys for Crashlytics verification.
- apps/mobile_flutter/lib/features/settings/theme_settings_screen.dart
- Added hidden QA identity diagnostics UI.

Phase 5G — Supporting repository behavior

- apps/mobile_flutter/lib/features/video_feed/repositories/video_feed_repository.dart
- `suggestedFeed()` and `trendingFeed()` now filter on `status == live` and usable playback URL readiness before enriching with creator identity.
- `_enrichWithUsernames()` resolves creator profile or user display names in session-scoped cache.
- `followingFeed()` merges multiple creator chunks for followed creators, with client-side `_isReady()` status filtering.

YOHPAL LIVE RELEASE Implementations Included

- YOHPAL LIVE RELEASE 1.0J-RC2 — Current release candidate implementation for mobile Flutter, matching source build-time releaseTag ``yohpal-live-v1.0j-rc2``.
- YOHPAL LIVE RELEASE 1.0G — Final Evidence & GA Certification Review.
- YOHPAL LIVE RELEASE 1.0E — Final GA Readiness Validation Report.

These release versions provide the implementation context for the feed regression analysis, QA identity wiring, and release readiness work captured in this report.

Root cause of No videos available yet

The empty feed is caused by the new filtering gate in VideoFeedController._filter():

- Firestore query returns live video documents.
- _isReady() in VideoFeedRepository already weeds out non-live or non-playable entries.
- Then _filter() drops any video missing required metadata, especially:
 - ageRating
 - creatorVerifiedForMinorContent
 - guardianConsentVerified
 - minorTargetedAdvertiserApproved
 - classificationCompleted
 - moderationStatus == 'approved'

Because these fields are stricter than before, a valid live video document can still be discarded and leave videos.isEmpty, which makes the UI show No videos available yet.

Suggested fix path

1. Confirm whether backend video documents are missing required minor-safety metadata.
2. If the metadata is absent for valid public videos, relax the client filter or ensure the backend populates:
 - ageRating
 - classificationCompleted
 - creatorVerifiedForMinorContent
 - guardianConsentVerified
 - minorTargetedAdvertiserApproved
3. Keep the UI empty-state branch as-is; it is behaving correctly for current filtered results.

Summary

- Implementation work centered on feed filtering, QA release identity, and Crashlytics certification support.
- The feed regression is not a rendering bug but a filter regression in VideoFeedController._filter().
- Flutter analyze is failing due to legacy zero-wait test and interface mismatches, not due to the core feed implementation.
- Device runtime validation is incomplete; the app launches, but a full physical feed E2E pass is still needed.
