This **Implementation Status Report** is exactly the kind of evidence that should drive release decisions because it compares the current codebase against the original Production Readiness Review rather than relying on plans or memory.

It materially changes the picture.

Executive Assessment

Compared with the original Production Readiness Review:

- **4 of 9 Critical findings are fully fixed**
- **1 of 9 Critical findings is mitigated**
- **0 of 13 High findings are fully fixed**
- **1 of 14 Medium findings is fixed**
- **1 of 4 Low findings is fixed**
- **Google Sign-In and Apple Sign-In** have been added as new capabilities.

IMPLEMENTATION_STATUS_REPORT.pdf

That is meaningful progress, but it is **not sufficient for General Availability**.

What Has Improved

The report confirms that Release Track **1.0B** (Money, Security & Wallet Reconciliation) has largely been implemented.

Fully Fixed

- Sign-out now exists in the UI.
- Client-controlled gift amounts have been eliminated in favor of a validated Cloud Function.
- Wallet reconciliation now has a real `WalletStatusScreen` and deep-link return flow.
- Firestore rules for `videoStats` and `referralEvents` have been tightened.
- Live-session gift totals are now updated server-side rather than by client writes.

IMPLEMENTATION_STATUS_REPORT.pdf

These directly reduce fraud and financial risk.

Partially Improved

Rewarded ads are better protected through elapsed-time validation, but the report states the **real fix still requires an actual ad SDK with server-side verification**.

IMPLEMENTATION_STATUS_REPORT.pdf

New Positive Work

The developers also delivered work beyond the original audit:

- Google Sign-In.
- Apple Sign-In.
- Login/signup redesign.
- First/last-name onboarding.
- Terms & Conditions gate.
- A backend payout bug fix.

IMPLEMENTATION_STATUS_REPORT.pdf

These improve usability, but they do not remove the remaining launch blockers.

Remaining Critical Blockers

The report still lists these as **open**:

- Analytics route crash.
- No Crashlytics/global error boundary.
- Password reset not implemented.
- Hardcoded production URLs (no environment abstraction).

IMPLEMENTATION_STATUS_REPORT.pdf

These continue to block GA.

High Severity

This is where progress has stalled.

The report states:

0 of 13 High findings fixed.

IMPLEMENTATION_STATUS_REPORT.pdf

Still open:

- Live reconnect handling.
- Search navigation.
- Live Discovery navigation.
- Feed retry.
- Accessibility.
- Test coverage.
- Duplicate video pipelines.
- Avatar upload.
- Chat error handling.
- Cross-account cache clearing.

These map directly to Releases **1.0A**, **1.0C**, and **1.0D**, which the report says were largely not started.

IMPLEMENTATION_STATUS_REPORT.pdf

Updated Readiness

Area	Status
Money & Fraud	Improved significantly
Authentication	Improved, but incomplete
Navigation	Still needs work
Crash Reporting	Missing
Observability	Missing
Feed UX	Needs improvement
Live Discovery	Built but not integrated

Test Coverage	Still inadequate
GA Readiness	Not yet ready

Release Board Recommendation

Release 1.0A

Partially complete.

Release 1.0B

Largely complete.

Release 1.0C

Not yet executed.

Release 1.0D

Not yet executed.

Executive GO / NO-GO

Controlled Testing

GO

Continue internal and invite-only testing.

General Availability

NO-GO

The remaining Critical and High findings must be addressed before a public launch.

Required Codebase — Release Gate Tracker

```
enum ReleaseGateStatus {
    open,
    mitigated,
    closed,
}

class ReleaseGate {
    final String id;
    final String title;
    final ReleaseGateStatus status;

    const ReleaseGate({
        required this.id,
        required this.title,
        required this.status,
    });
}

final release10Tracker = [
    ReleaseGate(
        id: "1.0A",
        title: "Account, Navigation & Observability",
        status: ReleaseGateStatus.open,
    ),
    ReleaseGate(
        id: "1.0B",
        title: "Money, Security & Wallet",
        status: ReleaseGateStatus.closed,
    ),
    ReleaseGate(
```

```
        id: "1.0C",
        title: "Feed, Live Discovery & UX",
        status: ReleaseGateStatus.open,
    ),
    ReleaseGate(
        id: "1.0D",
        title: "Cleanup, Tests & Release Gate",
        status: ReleaseGateStatus.open,
    ),
];

enum GaDecision {
    go,
    conditionalGo,
    noGo,
}

GaDecision determineGa({
    required int criticalOpen,
    required int highOpen,
}) {
    if (criticalOpen > 0) return GaDecision.noGo;
    if (highOpen > 3) return GaDecision.conditionalGo;
    return GaDecision.go;
}
```

Overall Conclusion

The report confirms that the team chose the correct priority by tackling the **money and fraud** risks first. That substantially improves the platform's security posture.

However, the report also makes it clear that **application integration, observability, and user-flow completion** remain the dominant barriers to General Availability. The release should therefore continue to prioritize stabilization over new feature work until those gaps are closed.

IMPLEMENTATION_STATUS_REPORT.pdf

NEXT SMART MOVE

Build: YOHPAL LIVE RELEASE 1.0F — FINAL GA BLOCKER ELIMINATION SPRINT

Mission:

Close every remaining Critical and High finding identified in the Implementation Status Report before requesting another Release Review Board decision.

Sprint A — Observability

- Integrate Firebase Crashlytics.
- Add `runZonedGuarded`, `FlutterError.onError`, and `PlatformDispatcher.onError`.
- Verify production crash reporting.

Sprint B — Authentication Completion

- Implement password reset using `sendPasswordResetEmail()`.
- Add email verification.
- Introduce friendly authentication error mapping.
- Complete client-side form validation.

Sprint C — Navigation & Discovery

- Fix the Analytics route crash.
- Wire Search into the main navigation.
- Wire Live Discovery into the main navigation.
- Add automated route integrity tests.

Sprint D — Feed & Live UX

- Add feed retry.
- Add pagination.
- Add mute/unmute.
- Add double-tap-to-like.
- Add LiveKit reconnect handling.
- Add accessibility semantics.

Sprint E — Code Quality

- Remove duplicate video pipelines.
- Expand automated tests for authentication, wallet, feed, SSO, and live streaming.

Success Criteria:

- ✅ All remaining Critical findings closed.
- ✅ High findings reduced to an agreed release threshold.
- ✅ Production Readiness Review re-run with no GA-blocking issues.
- ✅ Release Review Board receives evidence for a new General Availability decision.

Outcome:

YohPal Live advances from a secure production candidate to a fully integrated application that is ready for a renewed General Availability certification review.
