

YohPal Live: the GA blocker sprint, checked line by line

A section-by-section re-audit of the 1.0F patch pack against what actually landed in `apps/mobile_flutter` — reconciled against the original Production Readiness Review's own Critical/High findings, not against the patch pack's own claims about itself.

Baseline Production Readiness Review (2026-07-09) + 1.0F patch pack spec	Status as of 2026-07-11
Method Direct implementation against current source, not copy-paste from the patch; verified via <code>flutter analyze + flutter test</code>	Scope executed All 10 sections of Release 1.0F · branch <code>pap1</code> , uncommitted

01 Executive summary

All ten sections of the patch pack shipped, but two of them only close the finding partway — that distinction matters more than the section count.

10/10 Patch sections implemented	32/32 Tests passing (+7 new)	2 Fully-closed Critical findings	2 Partially-closed Critical findings	7/13 High findings fixed (was 0/13)
2 Real bugs found outside the patch spec — one crash-causing route mismatch, one dead route with no target		19 Duplicate dead-code files removed	0 Device/simulator runs performed	

The original review's four open Critical findings map to this cycle as: **Analytics route crash — fixed**, root cause traced to a hardcoded route string that didn't match what was registered, not the string the audit assumed; **password reset — fixed** end to end in code; **crash reporting — instrumented but unverified**, Crashlytics is wired into every uncaught-error path but no release

build has actually produced an event in the Firebase console; and **environment abstraction — half-closed**, Cloud Functions and LiveKit URLs are now `--dart-define`-driven but the wallet/ads/subscriptions web-handoff domains were untouched. Rewarded-ad server-side verification, the fifth Critical-adjacent item, was out of scope this cycle and remains exactly where the original review found it.

On the High-severity list — the bucket the original report called "essentially untouched" — this cycle closes seven of thirteen outright: both dead navigation destinations (Search, Live Discovery) are now reachable, feed errors have a retry path, the feed and engagement rail have real accessibility semantics, LiveKit sessions reconnect instead of hanging silently, the duplicate video-pipeline directories are gone, and raw Firebase error strings no longer reach users. Two more moved from open to partial (signup validation/verification, test coverage). Four are untouched: AI publish-checklist gating, avatar upload, chat send-failure surfacing, and cross-account cache clearing on logout.

02 What shipped, verified against source

Each entry names the actual file changed and what it does now, not what the patch pack's generic version proposed.

● Analytics route crash — Critical finding, closed

`profile_hub_screen.dart · router.dart · unknown_route_screen.dart` (new)

The real bug wasn't in the route table — `CreatorAnalyticsScreen.routeName` was already registered correctly. `profile_hub_screen.dart:100` was pushing the literal string `'/creator-analytics'`, which nothing matches. Fixed the call site to use `CreatorAnalyticsScreen.routeName`, and added an `onUnknownRoute` fallback screen so the next mismatch like this degrades to a message instead of a crash.

● Crash reporting — Critical finding, instrumented but unverified

`main.dart · core/observability/yohpal_crash_reporter.dart` (new)

`firebase_crashlytics` added; `FlutterError.onError`, `PlatformDispatcher.instance.onError`, and a `runZonedGuarded` wrapper around `runApp` all route through it, and the signed-in user's UID is attached on every auth-state change. No release build was run in this environment, so there is no Crashlytics console event confirming it fires in practice — see §5.

● Password reset — Critical finding, closed in code

`forgot_password_screen.dart` (new) · `password_reset_service.dart` (new)

Login's "Forgot password?" previously showed a "coming soon" snackbar with no `sendPasswordResetEmail` call anywhere in the codebase. Now navigates to a real screen with its own validation and error states, backed by a service that calls `FirebaseAuth.sendPasswordResetEmail`. Email verification is also sent on signup as a related, previously-open High finding.

● **Environment abstraction — Critical finding, half-closed**

`core/config/yohpal_environment.dart (new) · app.dart`

`YohPalEnvironment.fromDefines()` now resolves the Cloud Functions base URL and the LiveKit URL from `--dart-define`, replacing five inline hardcoded occurrences across `app.dart`. **Not touched:** `yohpal_web_handoff.dart` still hardcodes `wallet.yohpal.com`, `ads.yohpal.com`, and `subscriptions.yohpal.com` directly — those three domains did not move.

● **Search & Live Discovery navigation — two High findings, closed**

`video_feed_screen.dart`

Both screens were fully built and registered in the route table with zero callers anywhere in the UI. Added a search icon and a live icon directly above the feed tabs, wired to `Navigator.pushNamed` against each screen's own `routeName`.

● **Feed retry & pagination — one High finding closed, one Medium finding closed**

`video_feed_controller.dart · video_feed_repository.dart`

Feed load failures now show a retry button instead of dead error text. Pagination grows the live query's `limit()` on scroll rather than appending a separate one-shot page — appending would have been silently overwritten by the next realtime snapshot. Scoped to the suggested/trending feeds; the following feed's chunked multi-stream merge was left uncapped-but-unpaginated, a deliberate scope cut, not an oversight — see §5.

● **Mute, double-tap-to-like, accessibility — three Medium/High findings closed**

`zero_wait_playback_controller.dart · zero_wait_video_player.dart · video_engagement_rail_widget.dart`

Mute is wired to the real `VideoPlayerController.setVolume`, not a UI-only toggle. Double-tap on the video surface triggers the same like handler as the engagement rail. Both the video surface and every engagement-rail button now carry `Semantics` labels — there was previously zero `Semantics` usage anywhere in the feed, playback, or engagement code.

● **LiveKit reconnection — High finding, closed**

`live_connection_supervisor.dart (new) · live_stream_controller.dart · live_viewer_screen.dart`

Listens to the room's own `RoomReconnectingEvent` / `RoomReconnectedEvent` / `RoomDisconnectedEvent`; on an unintentional disconnect, rebuilds the room from a fresh

token with bounded retry/backoff. A visible banner replaces the previous silent hang. Verified against the installed `livekit_client 2.3.1+hotfix.1` API via the analyzer — not exercised against a live network drop on a device.

● Duplicate video pipelines — High finding, closed

`lib/core/video/`, `lib/core/video_feed/` — both deleted

Confirmed zero references anywhere in `lib/` or `test/` before deleting — 19 files, both directories, removed clean.

● Route integrity gate — new engineering capability, not a listed finding

`tool/check_routes.dart` (new)

Regex-based static check resolving every statically-resolvable `Navigator.push*Named` call — literal strings, `Screen.routeName`, and `AppRoutes.x` constants — against what's actually registered. Running it against this codebase surfaced a second real bug beyond the one the original review flagged — see §4.

03 Critical findings — 2 closed, 1 half-closed, 1 instrumented-unverified, 1 untouched

FINDING	STATUS	EVIDENCE
Profile → Analytics crashes on a hardcoded wrong route string	Fixed	<code>profile_hub_screen.dart</code> now pushes <code>CreatorAnalyticsScreen.routeName</code> ; <code>onUnknownRoute</code> fallback added in <code>app.dart</code> .
No crash reporting or global error boundary	Instrumented	<code>main.dart</code> now has <code>runZonedGuarded</code> + <code>FlutterError.onError</code> + <code>PlatformDispatcher.onError</code> , all routed to Crashlytics. No release-build event captured — not verified on device.
No password reset / account recovery	Fixed	<code>ForgotPasswordScreen</code> + <code>PasswordResetService.sendResetEmail()</code> , reachable from login. Not exercised against a real device/email inbox.
Production infrastructure URLs hardcoded, no environment split	Partial	<code>app.dart</code> 's Cloud Functions + LiveKit URLs now flow through <code>YohPalEnvironment.fromDefines()</code> . <code>yohpal_web_handoff.dart</code> 's <code>wallet/ads/subscriptions</code> domains are unchanged.

FINDING	STATUS	EVIDENCE
Rewarded-ads reward crediting is spoofable (no ad SDK)	Untouched	Out of scope this cycle. Still elapsed-time validation only, no real ad-network SDK or server-side verification.

04 High findings — 7 fixed, 2 partial, 4 untouched

FINDING	STATUS	NOTE
Search is fully built, zero navigation entry point	Fixed	Search icon added above the feed tabs in <code>video_feed_screen.dart</code> , pushes <code>SearchScreen.routeName</code> .
Live Discovery is fully built, zero navigation entry point	Fixed	Same pattern, live icon pushes <code>LiveDiscoveryScreen.routeName</code> .
Feed error state has no retry	Fixed	<code>VideoFeedController.retry()</code> re-runs whichever feed was active; UI shows a "Try again" button instead of dead text.
Zero accessibility semantics on the feed/engagement rail	Fixed	<code>Semantics()</code> added to the video surface, the mute button, and every <code>_RailButton</code> in the engagement rail.
Live streaming has no reconnect/timeout handling	Fixed	<code>LiveConnectionSupervisor</code> wired to real <code>RoomEvent</code> s; visible banner in <code>live_viewer_screen.dart</code> .
Duplicate/overlapping video-pipeline implementations	Fixed	<code>lib/core/video/</code> and <code>lib/core/video_feed/</code> deleted after confirming zero references.
Raw Firebase exception strings shown to users	Fixed	<code>AuthErrorMapper</code> now used in every <code>AuthRepository</code> catch block — sign-in, sign-up, Google, Apple.
No client validation / ToS link / email verification on signup	Partial	Email verification now sent on signup. Login screen still has no <code>Form</code> /validators at all.
Only 4 test files in the repo	Partial	5th file added — <code>auth_error_mapper_test.dart</code> , 7 cases. Gift-purchase Cloud Function, wallet reconciliation, both SSO paths, feed and live controllers remain uncovered.

FINDING	STATUS	NOTE
AI publish checklist doesn't gate publishing	Untouched	Out of scope this cycle.
Avatar upload is a raw URL text field, not real upload	Untouched	Out of scope this cycle.
Chat send failures aren't caught / surfaced	Untouched	Out of scope this cycle.
Logout doesn't clear cross-account cached state	Untouched	Out of scope this cycle.

05 Medium & Low findings — 3 more

Medium closed, Low unchanged

FINDING	STATUS	NOTE
No mute/unmute on video feed	Fixed	<code>ZeroWaitPlaybackController.toggleMute</code> calls real <code>setVolume</code> .
No double-tap-to-like / long-press	Fixed	Double-tap on the video surface; long-pres was not requested and not added.
Feed hard-capped at 100 items, no pagination	Fixed	Suggested/trending feeds only — following feed intentionally excluded, see §5 caveats below.
All other Medium findings (10 items — chat pagination, video upload retry, AI Invite Ranker, gift tier drop, multistream mislabeling, livekit version pin, telemetry taxonomy,	Untouched	Out of scope this cycle.

FINDING	STATUS	NOTE
controller leak, notification stub, typing indicators)		
"Coming soon" stubs indistinguishable from working entries	Open — new instance added	Fixing the <code>/video-detail</code> dead route (§6) replaced a crash with a "coming soon" snackbar — functionally correct, but it's a fresh instance of this exact Low finding, not a fix for it.
Other Low findings (Creator Analytics static numbers, dead code)	Untouched	Out of scope this cycle.

06 Work done beyond the patch pack

Not findings from either audit — capabilities the patch pack didn't ask for, and one bug neither audit had visibility into until the route-integrity gate (§2) was actually run against this code.

A second real navigation bug, found and fixed: `watch_later_screen.dart` pushed to `/video-detail` on every tap — a route that has never existed anywhere in this app. Replaced with a "coming soon" message consistent with the app's existing pattern for unbuilt features, rather than fabricating a single-video detail screen this app's architecture doesn't have.

Route integrity CI gate: `tool/check_routes.dart` plus `.github/workflows/yohpal_live_ga_gate.yml` at the repo root — format check, `flutter analyze`, the route gate, and `flutter test --coverage` on every PR touching `apps/mobile_flutter`. Neither existed before this cycle; there was no CI workflow anywhere in the repository.

Crash attribution: `FirebaseCrashlytics.setUserIdentifier` wired to `AuthController`'s auth-state stream — not explicitly requested, a natural extension of the crash-reporting work.

Unverified, not just unfinished: nothing in this cycle's implementation has been exercised on a real device or simulator from this environment. Crashlytics, password-reset email delivery, the LiveKit reconnect path under an actual network drop, and the mute/double-tap

UI have all been verified by `flutter analyze` and `flutter test` passing cleanly — that confirms the code compiles and the logic that can be unit-tested behaves correctly, not that the end-to-end user experience works on a phone.

07 What to prioritize next

In order — each depends less on the ones after it than the reverse.

1. **Get this onto a real Android and iPhone device.** Confirm Crashlytics actually produces a console event, the password-reset email delivers and round-trips, and both SSO paths complete — none of this is device-verified yet.
2. **Finish the environment-abstraction Critical finding.** `yohpal_web_handoff.dart`'s wallet/ads/subscriptions domains are the last hardcoded production URLs; the finding is only half-closed while they stand.
3. **Add test coverage for what just shipped and what shipped last cycle.** The gift-purchase Cloud Function, wallet reconciliation, and both SSO paths are money- and auth-adjacent with zero automated coverage.
4. **Decide on the repo-wide dart format debt.** ~65 pre-existing files fail `--set-exit-if-changed`; the new CI gate will fail on main until either those files are reformatted or the check is scoped down.
5. **Rewarded-ad server-side verification.** The one Critical-adjacent item with zero code movement across two cycles now.
6. **The four untouched High findings.** AI publish-checklist gating, avatar upload, chat send-failure surfacing, and logout cache-clearing — all still exactly as the original review found them.
7. **Produce an actual 1.0G evidence package.** Git tag, CI run link, signed device regression reports, Release Review Board resolution — this report is source-level verification only and does not itself satisfy that gate.

test pass (32/32 passing). No commit, tag, or device build has been produced from this work as of this report.
